Comment-Additional isoforms seem to exist. There is probably comment-Additional isoforms seem to exist. There is a cambination of five more than 96 isoforms. There is a combination of five alternatively spliced domains at sites 1 to 5, each consisting of modular sequences (A-G) that seem to be used independently. For splice site 1 additional splice modules might be possible thus increasing the number of possible isoforms. Beta isoforms (AC Q28142) share the combination of two alternatively spliced domains at sites 4 and 5. Experimental confirmation may be lacking for some isoforms:
alternative splicing and expressed in distinct subsets of neurons."; Neuron 14:497-507(1995).
                                                                                                                                                                                                       "Structure and evolution of neurexophilin.";
J. Neurosci. 16:4360-4369(1996).

MISCELLANEOUS: Alpha-latroxin competes with alpha-dystroglycan for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Evert=Alternative, in the splicing, Named isoforms=1, Comment=Alternative Splicing, Named isoforms may be produced by alternative Comment=At least 96 isoforms may be produced by alternatively spliced applicing. There is a combination of five alternatively spliced domains at sites 1 to 5, each consisting of modular sequences (A-G) that seem to be used independently. For splice site 1 additional splice modules might be possible thus increasing the number of possible isoforms. Beta-type isoforms (AC Q63373) share the combination of two alternatively spliced domains at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              -1- SUBBURT: Binds SYTL1 (By similarity). The cytoplasmic C-terminal region binds to CASK. Laminin G-like domain 2 binds to NXPH1 and NXPH3. Isoforms alpha 2C and alpha 4C bind to alpha-dystroglycan. Isoforms alpha 4C bind to alpha-latroxin.
-1- SUBCELLULAR LOCATION: Type I membrane protein (Potential).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         by interaction

Isold=0494813-3; Sequence=VSP 050036;
TISSUE SPECIFICITY: Fetal lung and kidney, and adult spinal cord.
Weak expression in adult adrenal gland, thyroid, trachea and other
tissues examined.
SIMILARITY: Contains 7 EGF-like domains.
SIMILARITY: Contains 13 leucine-rich (LRR) repeats.
SIMILARITY: Contains 1 C-terminal cystine knot-like (CTCK) domain.
SIMILARITY: Contains 1 laminin G-like domain.
                                                                                                                                                                                                                   Isold=094813-2; Sequence=VSP_050035, VSP_050036;

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

An assay for the diagnosis or assessment of the severity of osteoarthritis or rheumatoid arthritis comprising detecting an isomerized or optically inverted protein in a sample. 

Disclosure; Page 46-67; 106pp; English.

The invention relates to an assay for the diagnosis or assessment of the severity of osteoarthritis or rheumatoid arthritis. The assay involves measuring (in a biological sample) the amount or presence of an isomerised or optically inverted protein or one or more isomerised or optically inverted fragments from proteins such as perlecan, biglycan, decorni, fibrillin-1 or protocadherin. The assay is useful for the diagnosis or assessment of the severity of osteoarthritis or rheumatoid arthritis. The present sequence is human perlecan protein

The present sequence represents a human protein, which is used in the method of the invention. The specification describes a method which uses at least one polypeptide or polymorleotide sequence belonging to the perlecan, precursor of the retinol-binding plasma protein, precursor of the genglioside GMZ activator, calgranulin B or saposin B protein familias. The method is used for detecting, preventing or treating a degenerative, neurological and/or auto-immune disease. The polymucleotides and polypeptides are used for diagnosis, prognosis, proprection and treatment of multiple sclerosis (in its various forms and parkinson's diseases, amyotrophic lateral sclerosis, rheumatoid playarthritis and lupus erythematosus, including use as vaccines and in gene therapy (expression of sense or antisense sequences). They can also be used to assess efficacy of potential therapeutic agents, particularly compounds that reduce or inhibit toxicity towards glial cells

Detecting, preventing and treating degenerative, neurological and autoimmune diseases, particularly multiple sclerosis, using specified polypeptides or related nucleic acid or ligand.

                                                                                                                                                                                                                                                                                   ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCN) primers, oligomers, and for chomosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal crivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food pupplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving abbarrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. Abgonolo-Abg30377 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in plant and command and an obtained in the printed specification, but was obtained in the command and an obtained in the command and an obtained in the command and and an obtained in the command and an obtained in the command and an obtained in the command and an obtained in the command and and an obtained in the command and an obtained in the command and an obtained in the command and an obtained in the command and an obtained in the command and an obtained in the command and an obtained in the command and an obtained in the command and an obtained in the command and an obtained in the command and an obtained in the command and an obtained in the command and an obtained in the command and an obtained in the command and an obtained in the command and an obtained in the command and an obtained and an obtained and obtained and obtained and obtained and obtaine

The present sequence represents a human polypeptide, which is used in the method of the invention. The specification describes a method which uses at least one polypeptide or polymorlectide sequence belonging to the perlecan, precursor of the retinol-binding plasma protein, precursor of the retinol-binding plasma protein, precursor of the ganglioside GMZ activator, calgranulin B or saposin B protein families. The method is used for detecting, preventing or treating a degenerative, neurological and/or auto-immune disease. The polymorlectides and polypeptides are used for diagnosis, prognosis, prevention and treatment of multiple sclerosis (in its various forms and parkinson's diseases, amyotrophic lateral sclerosis, rheumatoid parkinson's diseases, amyotrophic lateral sclerosis, rheumatoid polyarthritis and lupus erythematosus, including use as vaccines and in gene therapy (expression of sense or antisense sequences). They can also be used to assess efficacy of pocential therapeutic agents, particularly compounds that reduce or inhibit toxicity towards glial cells
                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              630

Detecting VD-associated features and VPI is useful for the screening, diagnosis or prognosis of VD, for determining the stage or severity of VD, for identifying a subject at risk of VD. Not for monitoring the effect of therapy administered to a subject having VD. Nucleic acids encoding a VPI or inhibiting the function of a VPI are useful for the treatment of VD and for gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Screening, diagnosis or prognosis of vascular dementia (VD), useful for determining stage of VD and monitoring the effect of VD therapy, comprises analyzing body fluid by 2-dimensional electrophoresis for

The invention relates to screening, diagnosis or prognosis of Vascular Dementia (VD) in a subject comprising analysing body fluid from the subject by 2-dimensional (2-D) electrophoresis to generate a 2-D array of catters containing at least one chosen feature whose relative abundance correlates with the presence, absence, stage or severity of VD or predicts the onset or course of VD, especially detecting in a sample of carborophinal fluid (CSF) from the subject one of 223 VD-associated cattering in a sample of creening, diagnosis or prognosis of VD, for identifying a subject at risk of VD or for monitoring the effect of therapy administered to a subject having VD. Nucleic acids encoding a VPI or inhibiting the function of a VPI are useful for the treatment of VD and for gene therapy
predicts the onset or course of VD, especially detecting in a sample of cerebrospinal fluid (CSF) from the subject one of 223 VD-associated protein isoforms (VPIS) (ABBS5801-ABBS6295) as fully defined in the specification. Detecting VD-associated features and VPI is useful for the screening, diagnosis or prognosis of VD, for determining the stage or the effect of therapy administered to a subject at risk of VD. For monitoring the effect of therapy administered to a subject having VD. Nucleic acids encoding a VPI or inhibiting the function of a VPI are useful for the treatment of VD and for gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Screening, diagnosis or prognosis of vascular dementia (VD), useful for determining stage of VD and monitoring the effect of VD therapy, comprises analyzing body fluid by 2-dimensional electrophoresis for features correlated with VD.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Vascular Dementia, VD; VD-associated protein isoform; VPI; screening;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to screening, diagnosis or prognosis of Vascular Dementia (VD) in a subject comprising analysing body fluid from the subject by 2-dimensional (2-D) electrophoresis to generate a 2-D array of features containing at least one chosen feature whose relative abundance correlates with the presence, absence, stage or severity of VD or
                                                                                                         The invention relates to screening, diagnosis or prognosis of Vascular bementia (VD) in a subject comprising analysing body fluid from the subject by 2-dimensional (2-D) electrophoresis to generate a 2-D array of features containing at least one chosen feature whose relative abundance correlates with the presence, absence, stage or severity of VD or predicts the onset or course of VD, especially detecting in a sample of cerebrospinal fluid (CSF) from the subject one of 223 VD-associated protein isoforms (VPIS) (ABB55801-ABB56255) as fully defined in the specification. Detecting VD-associated features and VPI is useful for the screening, diagnosis or prognosis of VD, for determining the stage or severity of VD, for identifying a subject at risk of VD or for monitoring the effect of therapy administered to a subject having VD. Nucleic acids encoding a VPI or inhibiting the function of a VPI are useful for the treatment of VD and for gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Screening, diagnosis or prognosis of vascular dementia (VD), useful for determining stage of VD and monitoring the effect of VD therapy, comprises analyzing body fluid by 2-dimensional electrophoresis for features correlated with VD.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Dementia; VD; VD-associated protein isoform; VPI; screening;

The invention relates to screening, diagnosis or prognosis of Vascular Dementia (VD) in a subject comprising analysing body fluid from the subject by 2-dimensional (2-D) electrophoresis to generate a 2-D array of features containing at least one chosen feature whose relative abundance correlates with the presence, absence, stage or severity of VD or predicts the onset or course of VD, especially detecting in a sample of cerebrospinal fluid (CSF) from the subject one of 223 VD-associated protein isoforms (VPIs) (ABB55801-ABB56295) as fully defined in the specification. Detecting VD-associated features and VPI is useful for the screening, diagnosis or prognosis of VD, for determining the stage or severity of VD, for identifying a subject at risk of VD or for monitoring the effect of therapy administered to a subject having VD. Nucleic acids encoding a VPI or identifying the function of a VPI are useful for the treatment of VD and for gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Screening, diagnosis or prognosis of vascular dementia (VD), useful for determining stage of VD and monitoring the effect of VD therapy, comprises analyzing body fluid by 2-dimensional electrophoresis for features correlated with VD.
                                                                                                                                                                                                                                                                                                                                                                                                                   Vascular Dementia, VD; VD-associated protein isoform; VPI; screening; diagnosis; prognosis; gene therapy.

The invention relates to an isolated polymucleotide (ACF64435-ACF64733)

conciding a Propionibacterium acnes protein. The invention also relates to encoding a propionibacterium acnes protein. The invention also relates to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a comprision invention, additionally encompasses expression vectors and host cells comprising a cinvention of the invention, and the invention and isolated T cell population comprising T cells prepared via this method; an isolated T cell population comprising P. acnes polypeptides, polymetric exting a national composition (comprising P. acnes polypeptides, polymetric extension and relative that express the polypeptide, antibodies, fusion proteins, T cell populations, or continuent and method for inhibiting the development of P. acnes in a configuration of action of parient; and method for inhibiting the development of P. acnes in a parient; and method for inhibiting the development of P. acnes in a parient; and method for inhibiting the development of P. acnes in a proteins, T cell populations or antigen-presenting cells that express the composition or antigen-presenting cells that express the polyment of P. acnes in a protein. The polymucleotides an immune response specific for a P. acnes or primers for nucleic acid hybridisation. The vaccine composition is useful for the expression of an immune acid composition is useful for diagnosing a diagnostic assay. The invention discloses a composition comprising two or more isolated rat or human polymucleotides or a polymucleotide which represents a fragment, derivative or allelic variation of the mucleic acid sequence. Also claimed are a vector comprising the novel polymucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence witch is differentially regulated in an animal subjected to pain and a chat is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a nagent the expression of a polymucleotide sequence which is differentially subjected to pain, a method for identifying a compound which regulates the expression of a polymucleotide sequence which is differentially compound that regulates the activity of one or more of the composition, a method for producing a pharmaceutical composition, a method for producing a pharmaceutical composition, a compound that regulates the activity of one or more of the sequence for identifying a compound that regulates the activity of one or more of the specification, a method for identifying a compound useful in treating continual a pharmaceutical composition composition composition composition or more polypeptides or their antibodies. The polypeptides given in the sequence presented is a rat protein (end or more of the sequence presented is a rat protein (end or more of the sequence data for identifying a medicament for treating pain, which is patent did not form part of the printed or the sequence data for this patent did not form part of the printed or the sequence data for the specification) but was obtained in electronic form directly from WIPO at the part of the protein contact of the printed or the sequence as a bott of the secuence of the specification of the sequence of the secuence of ftp.wipo.int/pub/published\_pct\_sequences

Sequence 2531 AA;

injury (CCI) and spared nerve injury (SNI)) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences.

The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a fit to perform the method, an array, a method for identifying an agent that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a compound that regulates the activity of one or more of the activity in an animal of one or more of the cativity in an animal of one or more of the activity in an animal of one or more of the activity in an animal of one or more of the activity in an animal of one or more of the activity in an animal of one or more of the activity in an animal of one or more of the activity in an animal of one or more of the activity in an animal of one or more of the activity in an animal of one or more of the activity in an animal of one or more of the activity in an animal of one or more of the activity in an animal of one or more of the activity in an animal of one or more of the activity in an animal of one or more of the activity in an animal of one or more of the activity in the activity in the polypeptides given in the activity in an animal or one or more of the activity in an animal of one or more of the activity in an animal of one or more of the activity in an animal or or more of the activity in an animal or one or more of the activity in an animal or one or more of the activity in an animal or identifying a compound useful in treating

The invention discloses a composition comprising two or more isolated rate or human polynuclectides or a polynuclectide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence the expression of a polynucleotide sequence which is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating pain an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more of pain and a pharmaceutical composition comprising the one or more of pain animal of one identifying a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction

Claim 1; Page; 1017pp; English.

```
pain and a pharmaceutical composition comprising the one or more poin and a pharmaceutical composition the polygoticatides or their antibodies. The polygoticatide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction thipty (CCI) and spared nerve injury (SNI) in an animal (e.g. gene the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Drosophila; developmental biology; cell signalling; insecticide;

```
The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insectiolates, therapeutical and pharmaceutical faruge. The invention discloses genomic DNA sequences (ABLi16.176-ABL30511), expressed DNA sequences (ABL16.176-ABL30511), expressed DNA sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from NIPO at ftp.wipo.int/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Disclosure; SEQ ID NO 37920; 21pp + Sequence Listing; English.

Sequence 2071, Application US/09540236

Patent No. 6673910
GENERAL INFORMATION:
GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO MORAXELLA CATARN
TITLE OF INVENTION: FOR DIAGNOSTICS AND THERAPEUTICS
FILE REPERENCE: 2709.2005-001
CURRENT APPLICATION NUMBER: US/09/540,236
CURRENT FILING DATE: 2000-04-04
NUMBER OF SEQ ID NOS: 3840
SEQ ID NO 2071
LENGTH: 579
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Patent No. 6551795

LOCATION: (B) LÖCATION 1...241
SEQUENCE DESCRIPTION: SEQ ID NO: 5434:
                TELECOMMUNICATION INFORMATION:
TELEPANE: (781)893-807
TELERAX: (781)893-807
TELERAX: (781)893-827
INFORMATION FOR SEQ ID NO: 5434:
SEQUENCE CHARACTERISTICS:
LENGTH: 241 amino acids
TYPE: amino acid
TYPE: amino acid
TOPOLOGY: linear
MOLECULE TYPE: protein
HYPOTHETICAL: YES
ORIGINAL SOUNCE:
ORGANISM: Enterococcus faecium
REFERENCE/DOCKET NUMBER: GTC-012

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 2, Application US/08125077

Sequence 2, Application US/08125077

Patent No. 5872231 5840863

GENERAL INFORMATION:

APPLICANT: Engvall, Eva

APPLICANT: Lavo, Ilmo

ITILE OF INVENTION: Nucleic Acids Encoding Merosin, Merosin

TITLE OF INVENTION: Nucleic Acids Encoding Merosin, Merosin

TITLE OF INVENTION: Nucleic Acids Encoding Merosin, Merosin

TITLE OF INVENTION: Nucleic Acids Encoding Merosin, Merosin

TITLE OF INVENTION: Nucleic Acids Encoding Merosin, Merosin

TITLE OF INVENTION: Nucleic Acids Encoding Merosin, Merosin

TITLE OF INVENTION: Nucleic Acids Encoding Merosin, Merosin

TITLE OF INVENTION: Nucleic Acids Encoding Merosin, Merosin

TITLE OF INVENTION: Nucleic Acids Encoding Merosin, Merosin

TITLE OF INVENTION: Nucleic Acids Encoding Merosin, Merosin

TITLE OF INVENTION: Nucleic Acids Encoding Merosin, Merosin

Sequence 19, Application US/08083590A
Patent No. 5786158
GENERAL INFORMATION:
APPLICANT: Artavanis-Tsakonas, S. et al.
TITLE OF INVENTION: Therapeutic And Diagnostic Methods
TITLE OF INVENTION: And Compositions Based On No. 5786158ch Proteins And
                                                                                                                                                                                                                                                                                                   Sequence 16, Application US/08185432
Patent No. 575052
